

# Mastering PostgreSQL Administration

BRUCE MOMJIAN

PostgreSQL is an open-source, full-featured relational database.  
This presentation covers advanced administration topics.

# Outline

1. Installation
2. Configuration
3. Maintenance
4. Monitoring
5. Recovery

# 1. Installation

- ▶ Click-through Installers

- ▶ MS Windows
- ▶ Linux
- ▶ OS X

- ▶ Ports

- ▶ RPM
- ▶ DEB
- ▶ PKG
- ▶ other packages

- ▶ Source

- ▶ obtaining
- ▶ build options
- ▶ installing

# Initialization (initdb)

```
$ initdb /u/pgsql/data
```

The files belonging to this database system will be owned by user "postgres".  
This user must also own the server process.

The database cluster will be initialized with locale "en\_US.UTF-8".  
The default database encoding has accordingly been set to "UTF8".  
The default text search configuration will be set to "english".

Data page checksums are disabled.

```
fixing permissions on existing directory /u/pgsql/data ... ok
creating subdirectories ... ok
selecting default max_connections ... 100
selecting default shared_buffers ... 128MB
selecting dynamic shared memory implementation ... posix
creating configuration files ... ok
running bootstrap script ... ok
performing post-bootstrap initialization ... ok
syncing data to disk ... ok
```

WARNING: enabling "trust" authentication for local connections  
You can change this by editing pg\_hba.conf or using the option -A, or  
--auth-local and --auth-host, the next time you run initdb.

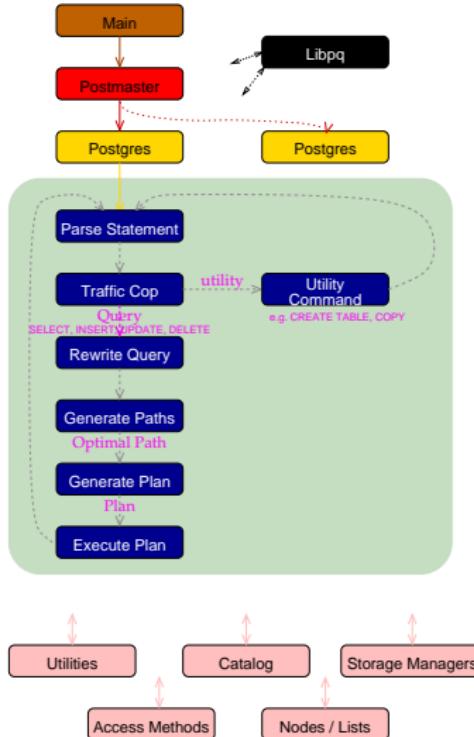

Success. You can now start the database server using:

```
pg_ctl -D /u/pgsql/data -l logfile start
```

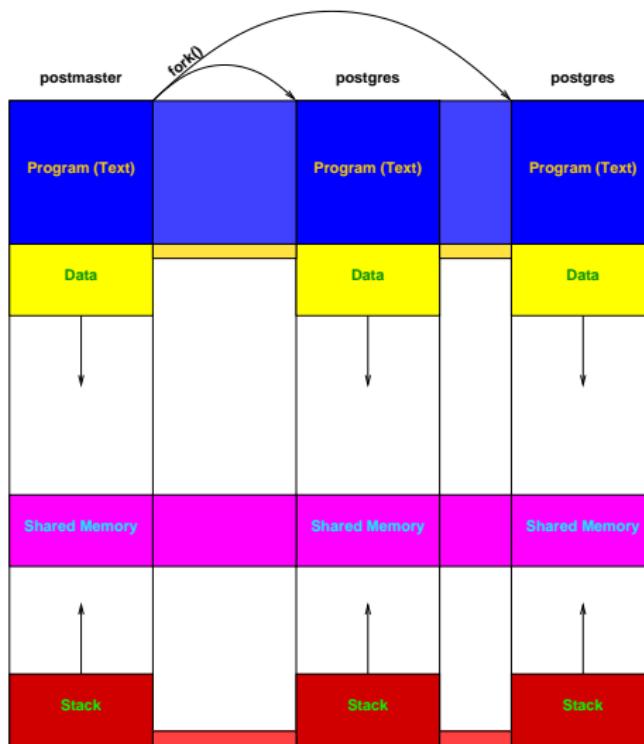

# pg\_controldata

# System Architecture

# Session Creation

# Starting Postmaster

```
2018-04-15 07:23:18.172 EDT [12055] LOG:  listening on IPv4 address "127.0.0.1", port 5432
2018-04-15 07:23:18.173 EDT [12055] LOG:  listening on Unix socket "/tmp/.s.PGSQL.5432"
2018-04-15 07:23:18.185 EDT [12056] LOG:  database system was shut down at 2018-04-15 07:22:54 EDT
2018-04-15 07:23:18.188 EDT [12055] LOG:  database system is ready to accept connections
```

- ▶ manually
- ▶ pg\_ctl start
- ▶ on boot

# Stopping Postmaster

```
2018-04-15 07:23:47.317 EDT [12055] LOG: received fast shutdown request
2018-04-15 07:23:47.318 EDT [12055] LOG: aborting any active transactions
2018-04-15 07:23:47.318 EDT [12055] LOG: worker process: logical replication launcher (PID 12062) exited with
2018-04-15 07:23:47.319 EDT [12057] LOG: shutting down
2018-04-15 07:23:47.327 EDT [12055] LOG: database system is shut down
```

- ▶ manually
- ▶ pg\_ctl stop
- ▶ on shutdown

# Connections

- ▶ local — unix domain socket
- ▶ host — TCP/IP, both SSL or non-SSL
- ▶ hostssl — only SSL
- ▶ hostnossal — never SSL

# Authentication

- ▶ trust
- ▶ reject
- ▶ passwords
  - ▶ scram-sha-256
  - ▶ md5
  - ▶ password (cleartext)
- ▶ local authentication
  - ▶ socket permissions
  - ▶ 'peer' socket user name passing
  - ▶ host ident using local identd

# Authentication (continued)

- ▶ remote authentication
  - ▶ host ident using pg\_ident.conf
  - ▶ kerberos
    - ▶ gss
    - ▶ sspi
  - ▶ pam
  - ▶ ldap
  - ▶ radius
  - ▶ cert

# Access

- ▶ hostname and network mask
- ▶ database name
- ▶ role name (user or group)
- ▶ filename or list of databases, role
- ▶ IPv6

# pg\_hba.conf Default

#	TYPE	DATABASE	USER	ADDRESS	METHOD
# "local" is for Unix domain socket connections only					
local	all		all		trust
# IPv4 local connections:					
host	all		all	127.0.0.1/32	trust
# IPv6 local connections:					
host	all		all	::1/128	trust
# Allow replication connections from localhost, by a user with the					
# replication privilege.					
#local	replication		postgres		trust
#host	replication		postgres	127.0.0.1/32	trust
#host	replication		postgres	::1/128	trust

# pg\_hba.conf Example

#	TYPE	DATABASE	USER	ADDRESS	METHOD
# "local" is for Unix domain socket connections only					
local	all	all			trust
# IPv4 local connections:					
host	all	all		127.0.0.1/32	trust
# IPv6 local connections:					
host	all	all		::1/128	trust
# disable connections from the gateway machine					
host	all	all		192.168.1.254/32	reject
# enable local network					
host	all	all		192.168.1.0/24	scram-sha-256
# require SSL for external connections, but do not allow the superuser					
hostssl	all	postgres		0.0.0.0/0	reject
hostssl	all	all		0.0.0.0/0	scram-sha-256

# Permissions

- ▶ Host connection permissions
- ▶ Role permissions
  - ▶ create roles
  - ▶ create databases
  - ▶ table permissions
- ▶ Database management
  - ▶ template1 customization
  - ▶ system tables
  - ▶ disk space computations

## 2. Configuration

<https://www.flickr.com/photos/mwichary/>

# postgresql.conf

```
# -----
# PostgreSQL configuration file
# -----
#
# This file consists of lines of the form:
#
#     name = value
#
# (The "=" is optional.) Whitespace may be used. Comments are introduced with
# "#" anywhere on a line. The complete list of parameter names and allowed
# values can be found in the PostgreSQL documentation.
#
# The commented-out settings shown in this file represent the default values.
# Re-commenting a setting is NOT sufficient to revert it to the default value;
# you need to reload the server.
```

# postgresql.conf (Continued)

```
# This file is read on server startup and when the server receives a SIGHUP
# signal. If you edit the file on a running system, you have to SIGHUP the
# server for the changes to take effect, run "pg_ctl reload", or execute
# "SELECT pg_reload_conf()". Some parameters, which are marked below,
# require a server shutdown and restart to take effect.
#
# Any parameter can also be given as a command-line option to the server, e.g.,
# "postgres -c log_connections=on". Some parameters can be changed at run time
# with the "SET" SQL command.
#
# Memory units: kB = kilobytes          Time units: ms  = milliseconds
#                  MB = megabytes          s    = seconds
#                  GB = gigabytes          min = minutes
#                  TB = terabytes          h    = hours
#                                         d    = days
```

# Configuration File Location

```
# The default values of these variables are driven from the -D command-line
# option or PGDATA environment variable, represented here as ConfigDir.

#data_directory = 'ConfigDir'          # use data in another directory
#                                # (change requires restart)
#hba_file = 'ConfigDir/pg_hba.conf'    # host-based authentication file
#                                # (change requires restart)
#ident_file = 'ConfigDir/pg_ident.conf' # ident configuration file
#                                # (change requires restart)

# If external_pid_file is not explicitly set, no extra PID file is written.
#external_pid_file = ''               # write an extra PID file
#                                # (change requires restart)
```

# Connections and Authentication

```
#listen_addresses = 'localhost'          # what IP address(es) to listen on;
                                         # comma-separated list of addresses;
                                         # defaults to 'localhost'; use '*' for all

### 3. Maintenance

# Backup

- ▶ File system-level (physical)
  - ▶ tar, cpio while shutdown
  - ▶ file system snapshot
  - ▶ rsync, shutdown, rsync, restart
- ▶ pg\_dump/pg\_dumpall (logical)
- ▶ Restore/pg\_restore with custom format

# Continuous Archiving / Point-In-Time Recovery (PITR)

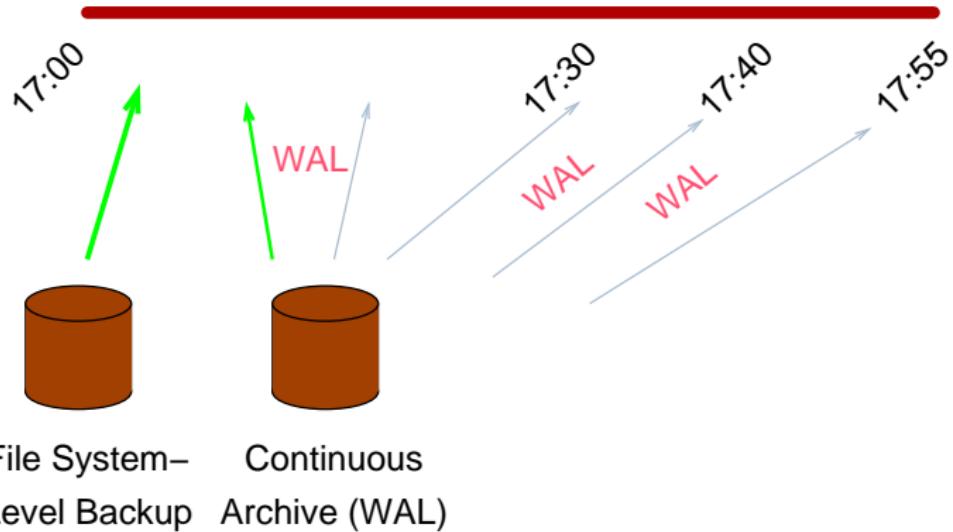

# PITR Backup Procedures

1. `archive_mode = on`
2. `wal_level = archive`
3. `archive_command = 'cp -i %p /mnt/server/pgsql/%f < /dev/null'`
4. `SELECT pg_start_backup('label');`
5. Perform file system-level backup (can be inconsistent)
6. `SELECT pg_stop_backup();`

*pg\_basebackup* does this automatically.

# PITR Recovery

# PITR Recovery Procedures

1. Stop postmaster
2. Restore file system-level backup
3. Make adjustments as outlined in the documentation
4. Create recovery.conf
5. `restore_command = 'cp /mnt/server/pgsql/%f %p'`
6. Start the postmaster

# Continuous Archive Management

Simplify backups and WAL archive file management with:

- ▶ *pgBackRest*
- ▶ *barman*

# Data Maintenance

- ▶ VACUUM (nonblocking) records free space into .fsm (free space map) files
- ▶ ANALYZE collects optimizer statistics
- ▶ VACUUM FULL (blocking) shrinks the size of database disk files

# Automating Tasks

Autovacuum handles vacuum and analyze tasks automatically.

# Checkpoints

- ▶ Write all dirty shared buffers
- ▶ Sync all dirty kernel buffers
- ▶ Recycle WAL files
- ▶ Controlled by *checkpoint\_timeout* and *max\_wal\_size*

## 4. Monitoring

# ps

```
$ ps -f -Upostgres
postgres  825      1  0 Tue12AM ??          0:06.57 /u/pgsql/bin/postmaster -i

# Monitoring Summary

time

## 5. Recovery

<https://www.flickr.com/photos/coastguardnews/>

# Client Application Crash

Nothing Required. Transactions in progress are rolled back.

# Graceful Postgres Server Shutdown

Nothing Required. Transactions in progress are rolled back.

# Abrupt Postgres Server Crash

Nothing Required. Transactions in progress are rolled back.

# Operating System Crash

Nothing Required. Transactions in progress are rolled back.  
Partial page writes are repaired.

# Disk Failure

Restore from previous backup or use PITR.

## Accidental DELETE

Recover table from previous backup, perhaps using pg\_restore. It is possible to modify the backend code to make deleted tuples visible, dump out the deleted table and restore the original code. All tuples in the table since the previous vacuum will be visible. It is possible to restrict that so only tuples deleted by a specific transaction are visible.

# Write-Ahead Log (WAL) Corruption

See `pg_resetwal`. Review recent transactions and identify any damage, including partially committed transactions.

# File Deletion

It may be necessary to create an empty file with the deleted file name so the object can be deleted, and then the object restored from backup.

# Accidental DROP TABLE

Restore from previous backup.

# Accidental DROP INDEX

Recreate index.

# Accidental DROP DATABASE

Restore from previous backup.

## Non-Starting Installation

Restart problems are usually caused by write-ahead log problems.  
See pg\_resetwal. Review recent transactions and identify any  
damage, including partially committed transactions.

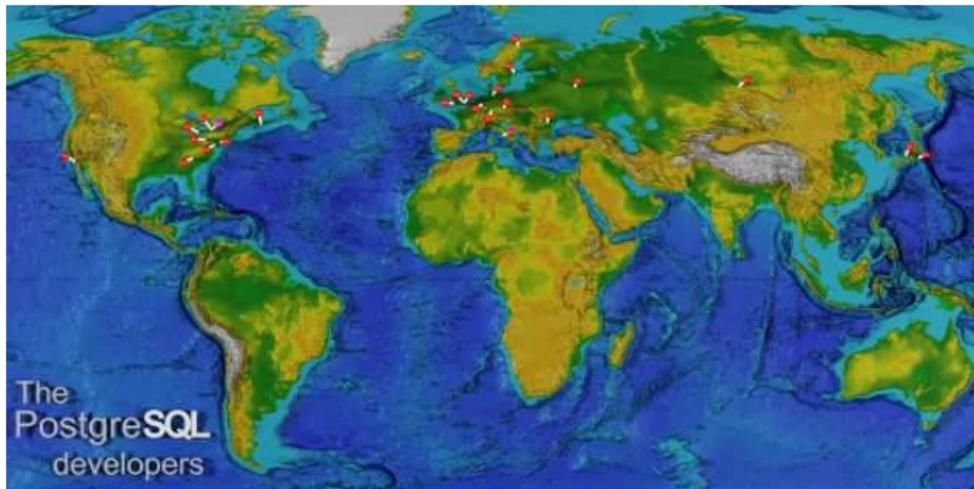

# Index Corruption

Use REINDEX.

# Table Corruption

Try reindexing the table. Try identifying the corrupt OID of the row and transfer the valid rows into another table using  
SELECT...INTO...WHERE oid != ###. Use `pageinspect` to analyze the internal structure of the table.

# Conclusion

*<http://momjian.us/presentations>*
